

SitePilot technical architecture

System boundaries, canonical study state, rendering adapters, and export authority

PAGE 1 / 3

SOURCE c73d5011d42d08199b3c85678c92b1fd6e8138b2 + current worktree · 25 AUG 2026

— Implemented / locally verified - - - Configured, not live-verified

Three-scheme generation and planning truth

Proposal intent is reviewable; geometry, figures, and planning status remain SitePilot authority

LOCAL FALLBACK VERIFIED · LIVE MODEL UNVERIFIED

ACTUAL CURRENT SEQUENCE

Google technology architecture and gap register

Confirmed source integration, configurable boundaries, and the smallest credible next work

A • Implemented and locally verified

Solid Google markers mean source and local behavior were inspected.

Google GenAI SDK • @google/genai 2.17.1

Imported by the shared AI client and proposal contract.
Local fallback and structured proposal response were tested.

Structured proposal boundary

Three proposals are schema-validated before use.
No live model invocation was made for this document.

Deterministic geometry remains authoritative.

B • Configured, not live-verified

Dashed Google boundaries are present in source or deployment config.

Gemini • `gemini-3.7-flash` `GEMINI\_MODEL` / provider metadata

Vertex AI via Cloud Run gateway ADC/IAM + bearer secret boundary in source

Cloud Build + Artifact Registry Build/test/push/deploy definitions exist

Still needed: hosted URL, IAM execution,
model response, logs, revision, cost evidence.

C • Recommended next implementation

Dotted components are proposals, not current capabilities.

1 • Persisted Taskmaster run Gemini plan → read-only tools → approval → report

2 • Firestore / Cloud Storage Account-backed cases, evidence, and artifacts

3 • Maps / Geocoding / Places Address and context; never cadastral authority

Only implement with owner-approved scope and billing.

Prioritized gap register

PRIORITY	GOOGLE TECHNOLOGY	PRODUCT VALUE	MISSING WORK	VERIFICATION
1	Gemini + persisted run	Credible multi-step planning assistant	Tools, checkpoints, approval, resume	Mock run + authorized live proof
2	Firestore / Cloud Storage	Shareable and auditable study state	Auth, rules, migration, artifact lineage	Threat model + multi-user test
3	Maps / Geocoding / Places	Reliable address and context	Provider adapter, attribution, cost guard	Synthetic lookup + failure fallback
—	Cloud proof	Supports a defensible submission story	Capture hosted revision, logs, model metadata	Owner-authorized non-production smoke test

Google technology does not equal formal hackathon compliance. The agentic workflow, hosted proof, owner attestations, licensing, and video remain separate gates.
